

Thunderbird LaTeX extension

Congratulations! You have successfully installed the Thunderbird LaTeX extension. Please take a few seconds to check that the settings we have found are correct.

Required software

This extension depends on a regular LaTeX distribution and the ImageMagick software. If you haven't installed them already, here are a few tips. If you are running Linux, both can be easily installed through your distribution's package manager. If running MacOS, [MacTeX](#) is probably what you're looking for. If running Windows, [MiKTeX](#) is known to work. The [ImageMagick website](#) offers binary downloads for MacOS and Windows.

If you choose to install this software now, please make sure you click "autodetect again" at the bottom of the page once you're done with the setup.

Autodetection results

We have found the required utilities to be in the following locations:

- LaTeX: `/usr/local/texlive/2007/bin/i386-darwin/tex` ✓
- dvips: `/usr/local/texlive/2007/bin/i386-darwin/dvips` ✓
- convert: `/usr/local/bin/convert` ✓

Are these settings correct?

Yes, don't bother me again

No, take me to the options screen

[Autodetect again](#)
