

Easy way using one font for all scripts :

« I could not find all the characters for `таблице`, and, of course, I have no clue for the Chinese `表` which I got from Google translate and thought I could copy-paste in a graphics program and make into a pdf but couldn't do. Even with the Vietnamese `bảng` `\overset{}{a}` does not properly place the accent. »

One can also use the `\setotherlanguage` option of `polyglossia` and then simply write `\textrussian{Русский} : Русский`. It may be more useful when dealing with text rather than single words.

Of course, if you want to select different fonts for different languages, try using

```
\newfontfamily{\chinois}{Adobe Fangsong Std}{\chinois 表}
```

表

```
\newfontfamily{\cyrillique}{Times}{\cyrillique таблице}
```

таблице
